Enhance your e-commerce site with personalisation and automate your production with PulseID! Businesses of all sizes can now display realistic and personalised renderings of all products. Offer your customers the very best options for choosing fonts, designs, colours and placement.

- Automated order management – From customer selection to finished production without manual handling.
- Seamless integration – Compatible with leading e-commerce platforms for smooth operation.
- Personalised design – Customers can easily choose fonts, colours and placement on their products.

Product description

PulseID E-commerce Plugin

Complement your e-commerce site with personalisation and automate your production with PulseID! Companies of all sizes can now display realistic and personalised renderings of all products. Offer your customers the very best options for choosing fonts, designs, colours and placement.

The PulseID E-commerce plugin is available for embroidery, digital printing and laser engraving. The workflow is automated from order to production in a single, unified administrator programme for all media types. No additional development is required, only configuration of your settings, products, designs and fonts.

Description

- Automated order management – From customer selection to finished production without manual handling.
- Seamless integration – Compatible with leading e-commerce platforms for smooth operation.
- Personalised design – Customers can easily choose fonts, colours and placement on their products.
- Efficient production control – Barcode system ensures fast and error-free handling in production.
- Complete control – Administration page provides an overview of order status and production flow.

Seamless integration with e-commerce platforms

The PulseID plugin has been created specifically for e-commerce platforms and makes work easier at all levels of your business with personalisation. Once your customer has decided on the desired design for the product and goes to the shopping cart on your e-commerce site, the order is created automatically and a work order with a barcode is printed from PulseID, which can then be scanned (embroidery, laser, engraving, printer). The barcode can then be read into the respective machine by the operator. The automatic process eliminates errors, such as spelling mistakes, colour choices and more, that might otherwise occur. In addition, the time spent on otherwise time-consuming machine settings and other handling by the operator is significantly reduced.

Complete customisation

With PulseID, you decide exactly which items will be available for the user to choose from. Easily select the fonts and colours to be displayed on your page. The user can customise different designs for different placements and garments based on what works best for the placement and product. Pricing between a large, complex design and a small, simple text is easily displayed on the screen.

Fully automated

This plugin utilises all the powerful technology that PulseID has to offer. No digitisation or manual intervention is required to create a design. Once a design template has been selected, all orders are created automatically along with production-ready files.

User-friendly

Once PulseID is installed on your e-commerce site, no further software development is required. You will learn how to create and add new design templates and add new products to the site quickly and easily. There is also a valuable PulseID administration page that shows status and gives you complete control over orders and production.
